

Test Description

MSI testing is used for Hereditary Cancer screening (Hereditary Non-Polyposis Colorectal Cancer -HNPCC or Lynch syndrome); As a biomarker (Prognostic and predictive biomarker for the response of Immunotherapy)

Patient Demographic

Name: S P Chowdhary Sex: Male Date of Birth/Age: 76 years Disease: Metastatic Stomach Carcinoma

PATIENT	REPORT DATE	BOOKING ID
S P Chowdhary	4 Apr 2019	011904040174

Clinician

Clinician Name: Dr Chandra Gouda Medical Facility: BLK Hospital Pathologist: Not Provided

Specimen

Site: Lesser curvature, greater curvature & anterior wall of fundus. Sample Type: FFPE block S7301/18 Date of Collection: 04-04-2019 Date of Booking: 04-04-2019

iMSI Rapid[™] Assay

Result

Microsatellite status - Stable

INTERPRETATION

BIOMARKER FINDINGS

ACVR2A	No mutation detected	
BTBD7	No mutation detected	
DIDO1	No mutation detected	
MRE11	No mutation detected	
RYR3	No mutation detected	
SEC13A	No mutation detected	
SULF2	No mutation detected	

Mutations are not detected in any of the 7 markers		
*MSS	<2 of the 7 markers demonstrate instability	
#MSI-H	\geq 2 of the 7 markers demonstrate instability	
*Microsatellite stable		
# Microsatellite Instability-High		
For valid bat	ch test results specific controls are being run with every batch.	

METHODOLOGY Multiplex detection of seven mononucleotide repeats using molecular beacon probe-based polymerase chain reaction followed by high resolution melt-curve analysis. The assay uses seven novel biomarkers *ACVR2A*, *BTBD7*, *DID01*, *MRE11*, *RYR3*, *SEC31A* and *SULF2* as this set of biomarkers is stable over different cancer types and ethnicities and show high performance than other known assays like *Bethesda Panel*. This test is carried out on Idylla platform using the MSI/1.0 Cartridge based kit which is CE IVD approved.
