

Test Description

KRAS mutation test is an *in vitro* diagnostic test for the qualitative detection of mutations in codons 12, 13, 59, 61, 117 and 146 of *KRAS* oncogene.

Patient Demographic

Name: Satish Goyal
Sex: Male
Date of Birth/Age: 72 Years
Disease: Caecum cancer

Clinician

Clinician Name: Dr Manish Singhal
Medical Facility: Apollo Hospital
Pathologist: Not Provided

Specimen

Site: Caecum
Sample Type: FFPE block B/4680/19
Date of Collection: 24-04-2019
Date of Booking: 24-04-2019

KRAS Mutation Analysis

Result**No Mutation Detected****GENOMIC FINDINGS**

No mutation detected in *KRAS* codon 12, 13, 59, 61, 117 and 146.

INTERPRETATION**No Mutation detected**

Current data suggest that the efficacy of EGFR-targeted therapies in colorectal cancer is limited to patients with tumors lacking *KRAS* mutations. Thus, the detection of a *KRAS* mutation within this tumor specimen suggests that such therapies may have limited therapeutic value for this patient.

METHODOLOGY

The *KRAS* Mutation test, performed on the Biocartis Idylla™ system, is an *in vitro* diagnostic test for the qualitative detection of 21 mutations (G12D, G12A, G12C, G12V, G12S, G12R, G13D, A59T/E/G, Q61H/Q61H, Q61K/Q61K, Q61R/L, K117N/K117N and A146P/T/V) in codons 12, 13, 59, 61, 117 and 146 of the *KRAS* gene. Formalin-fixed paraffin-embedded (FFPE) human cancer tissue is lysed liberate DNA for subsequent real-time PCR amplification using allele specific primers. Amplification of a *KRAS* sequence in intron4/exon5, serving as a sample processing control, is included in each run. The presence of a mutant genotype is determined by calculating the difference between the *KRAS* Sample Processing Control Cq and the Cq obtained for the *KRAS* mutant signal(s). The analytic sensitivity of this assay has been determined at < or = 5%
