Human Epidermal Growth Factor Receptor 2 Immunohistochemistry

Clinician

Human Epidermal Growth Factor Receptor 2

(HER2/neu): Negative (Score 0)

Clinician Name: Dr. Archit Pandit Medical Facility: Max Hospital Pathologist: Not Provided

Test Description

Test is useful for determining overexpression of HER2 protein of gastric and esophageal adenocarcinoma in formalin-fixed, paraffinembedded tissue sections (with reflex to FISH testing).

Clinical Information

Human epidermal growth factor receptor 2 (*HER2*), is a protooncogene located on chromosome 17q21 that encodes a transmembrane protein with tyrosine kinase activity, a member of the HER receptor family and is involved in signal transduction pathways, leading to cell growth and differentiation. Amplification and overexpression of the *HER2* gene have been associated with a shorter disease-free survival and shorter overall survival in gastric and gastroesophageal junction cancers, as well as breast, endometrial, and ovarian cancer.

Specimen

Sample Type: FFPE block SB-4164-19

Site: Endometrium

Pathology ID: MOLQ/IHC-01012020 **Disease**: Carcinosarcoma Endometrium

Scoring

The scoring system is based on type and origin of tumor.

Score	Staining Pattern	Interpretation
0	No reactivity or membranous reactivity in	Negative
	<10% of cancer cells	
1+	Faint or barely perceptible membranous	Negative
	reactivity in ≥10% if cancer cells; cells are	
	reactive only in part of their membrane.	
2+	Weak to moderate complete, basolateral or	Equivocal
	lateral membranous reactivity in ≥10% of	•
	tumor cells	
3+	Strong complete, basolateral or lateral	Positive
	membranous reactivity in >10% of cancer cells.	

Interpretation

Results are reported as positive (3+ HER2 protein expression), equivocal (2+), or negative (0 or 1+).

Equivocal (2+) cases will automatically reflex to FISH testing at an additional charge.

Methodology

Immunostaining for HER2 protein was done using PathnSitu Rabbit Anti-Human HER2 monoclonal (Clone EP3) antibody (#PR047)
