**Comments**

Allergy panels / Allergen specific IgE includes only common causative allergens and does not include all possible allergens.

In cases of food allergy, specific IgE antibodies may be undetectable inspite of a convincing clinical history because these antibodies may be directed towards allergens that are revealed or altered during industrial food processing, cooking or digestion and therefore do not exist in the original food for which the patient is tested.

Normal IgE levels do not necessarily exclude the possibility of allergy because certain allergies can be non-IgE mediated.

All results should be interpreted in relation to the individual case history.

Test results released pertain to the specimen submitted.

All test results are dependent on the quality of the sample received by the Laboratory.

Test results may show interlaboratory variations.

A pseudo allergic or anaphylactoid reaction, looks like an allergic drug reaction, but it may not be allergy. drug contain many different substances like dyes, chemicals which can cause allergy like reaction, but it may be drug intolerance or hypersensitivity.

True drug allergy test is ige mediated reaction, it does not happen the first time you take a medication, much more likely to occur after your body has been exposed to the medication at least once or more. the first exposure allows body to create antibody and memory lymphocytic cells for the antigen.

**Method: ELISA/ImmunoCAP**
