PLEASE NOTE:

This interpretation assumes that patient and specimen details are accurate and correct. In all cases where an assessment of increased risk is based on LMP dates, the gestational age must be confirmed by ultrasound before further action is taken.

It must be clearly understood that the results represent risks and not diagnostic outcomes. Increased risk does not mean that the baby is affected, and further tests must be performed before a firm diagnosis can be made. A low risk result does not exclude the possibility of Down's syndrome or other abnormalities, as the risk assessment does not detect all affected pregnancies. The company strongly recommends that only NT values from qualified experts are utilized to provide a 1st trimester risk. These results were analyzed with LifeCycle software from PerkinElmer Life and Analytical Sciences.
