Name	Siri Dhar	Age : 90 Years	Sex : Male
Ref By	Amcare Hospital		

DIAGNOSIS: BCR/ABL1 t(9;22) - CML, ALL, AML-M1

METHODOLOGY: Fluorescence *in situ* Hybridization (FISH)

PROBE NAME: BCR/ABL1, DC-DF Translocation Probe (CE) (Abbott Mol., Inc.)

ICSN: nucish (ABL1,BCR)x1 (ABL1 con BCRx1)[40/200],

INTERPRETATION:

Interphase FISH using probe specific for BCR/ABL1 showed 20% cells positive for BCR/ABL fusion.

FISH:

Interphase cell showing one copy of chromosome 9 (orange) and one copy of chromosome 22 (green) and one fusion (yellow) signal.

RECOMMENDATION:

Correlation with clinical and pathological findings is recommended. Treatment decisions should not be solely based on the information contained in this report.

Please Note: Although the methodology used in this analysis and interpretation is highly accurate, it does not detect small rearrangements and very low-level clonal abnormalities, which are detectable only by molecular methods. Failure to detect an alteration at any locus does not exclude the diagnosis of any diseases or disorders. Interphase analysis may not detect structural abnormalities for the chromosomes tested. In addition, chromosome abnormalities from other regions of the genome, which do not involve the probes tested, cannot be detected by this FISH analysis.
