Ultrasound Data			Down's Syndrome Risk (Trisomy 21 Screening)		
Gestational age	17+4		The calculated risk for Trisomy 21 (with nuchal translucency) is below the cut off which indicates a low risk.		
Method	CRL (<>Robinson)		After the result of the Trisomy 21 test it is expected that among more than 10000 women with the same data, there is one woman with a trisomy 21 pregnancy.		
Gestational age at sample date	17+4		The HCG level is low.		
Risk			The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician.		
			The patient combined risk presumes that NT measurement was done according to accepted guidelines (Prenat Diagn 18:511-523; 1998).		
			Please note that the risk calculations are statistical approaches and have no diagnostic value!		
			Trisomy 18		
			The calculated risk for Trisomy 18 is <1:10000, which indicates a low risk		
			Neural Tube Defect (NTD) Screening		
			The corrected MoM for AFP (0.72) is located in the low risk area for neural tube defects.		

The laboratory can not be held responsible for their impact on the risk assessment! Calculated value has no diagnostic value!
