Risk	Down's Syndrome Risk (Trisomy 21 Screening)
 <p>The graph shows risk levels for Trisomy 21 and Neural Tube Defect (NTD) screening. The y-axis represents risk (1:10, 1:100, 1:250, 1:1000, 1:10000) and the x-axis represents gestational age (13-49 weeks). A vertical line at 19+2 weeks indicates the current gestational age. The area above the line is red (Risk Above Cut Off), the area below the line and above the age risk curve is yellow (Risk below Cut Off but above Age Risk), and the area below the age risk curve is green (Risk below Cut Off). The AFP MoM of 0.45 is located in the green area, indicating a low risk for NTD.</p>	<p>The calculated risk for Trisomy 21 is below the cut off which represents a low risk. After the result of the Trisomy 21 test it is expected that among 1066 women with the same data, there is one woman with a trisomy 21 pregnancy and 1065 women with not affected pregnancies.</p> <p>The calculated risk by PRISCA depends on the accuracy of the information provided by the referring physician. Please note that the risk calculations are statistical approaches and have no diagnostic value.</p>
	<p>The calculated risk for Trisomy 18 is &lt;1:10000, which indicates a low risk</p>
	<p>Neural Tube Defect (NTD) Screening</p> <p>The corrected MoM for AFP (0.45) is located in the low risk area for neural tube defects.</p>

The laboratory can not be held responsible for their impact on the risk assessment! Calculated value has no diagnostic value!
